

# TCP-BASED 網路品質監控

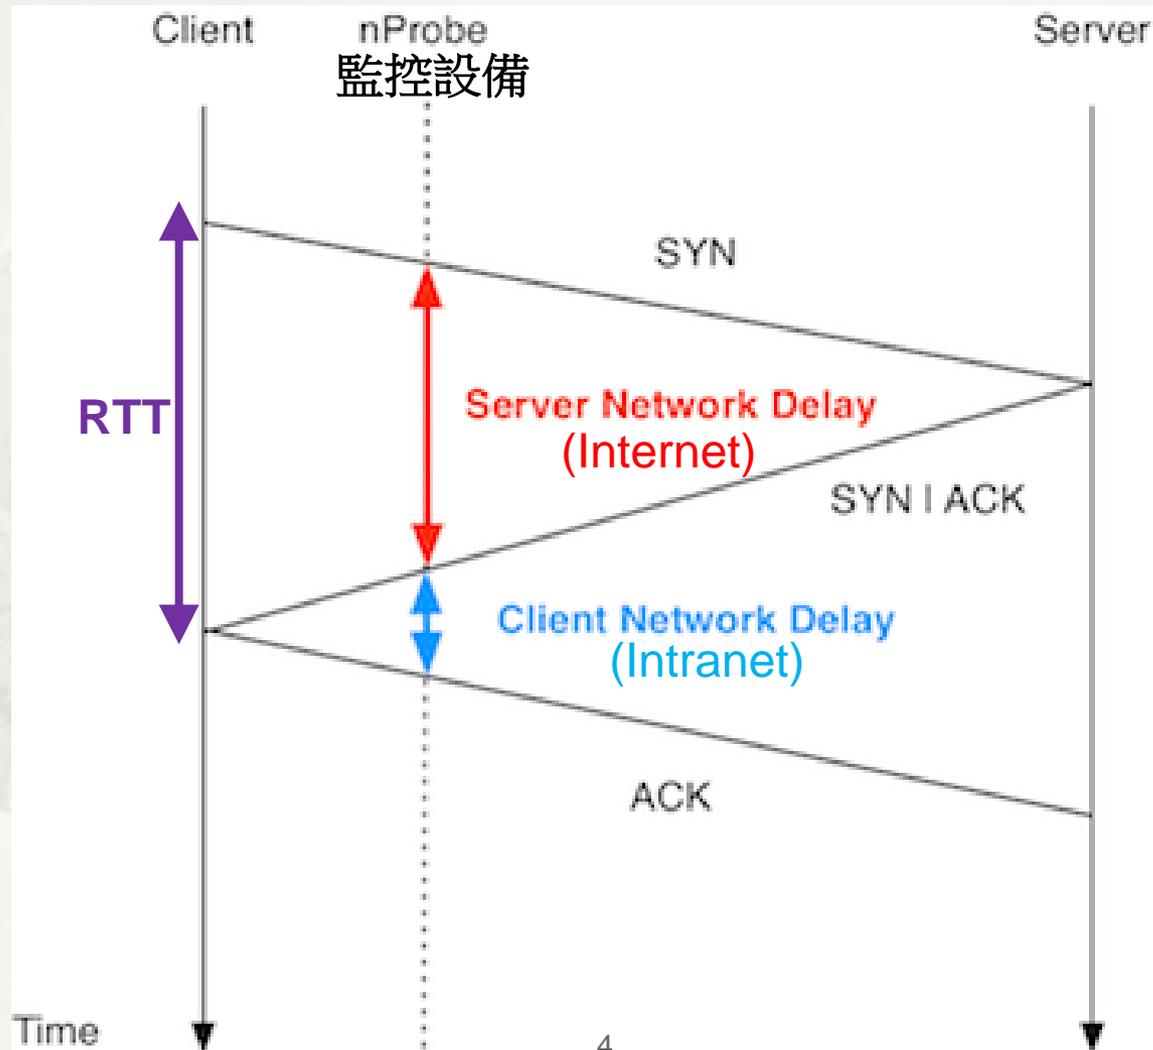

# 傳統網路品質監控

- \* 監控方法: ICMP Ping、TraceRoute
  - \* Round Trip Time(RTT)
  - \* Packet Lost
- \* 缺點與限制:
  - \* 需對方設備回應 ICMP Ping
  - \* 主動式偵測佔用頻寬資源
  - \* 無法大量佈建與監控:
    - \* 國網於所有區網中心與部分雲端佈建監控設備
  - \* 需有專用設備與軟體才能進行 24Hr 監控與統計

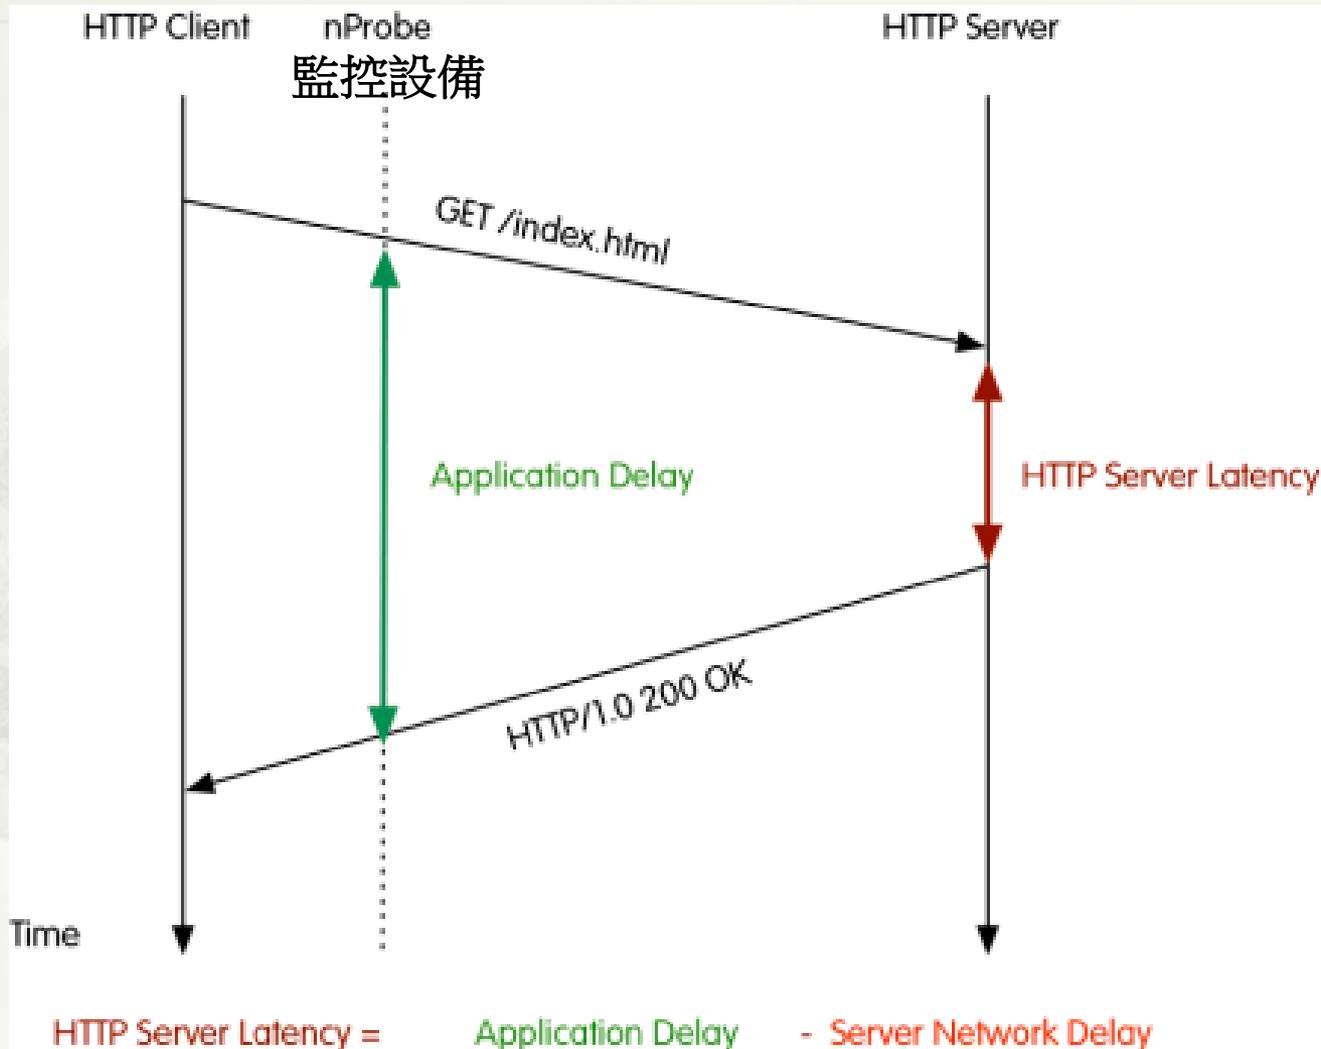

# TCP-based 網路品質監控

- \* 監控方法: TCP
  - \* RTT: TCP 3-way handshake
  - \* Packet Lost: TCP Retrasmit & OutOfOrder

# Network Latency

# Application Latency

# 監控設備

## \* 新一代 Router

### \* Cisco Application Visibility and Control Solution (Cisco AVC)

#### \* Cisco ASR 1000

### \* Use Netflow V9/V10 自訂格式

#### \* flow record name

collect connection delay network to-server sum

collect connection delay network to-client sum

collect connection delay application sum

collect connection client counter packets retransmitted

## \* Mirror/SPAN 到外部設備進行分析

### \* Cisco Flow Sensor

### \* nProbe (教育與研究機構免費)

## \* Inline 設備: Proprietary Report

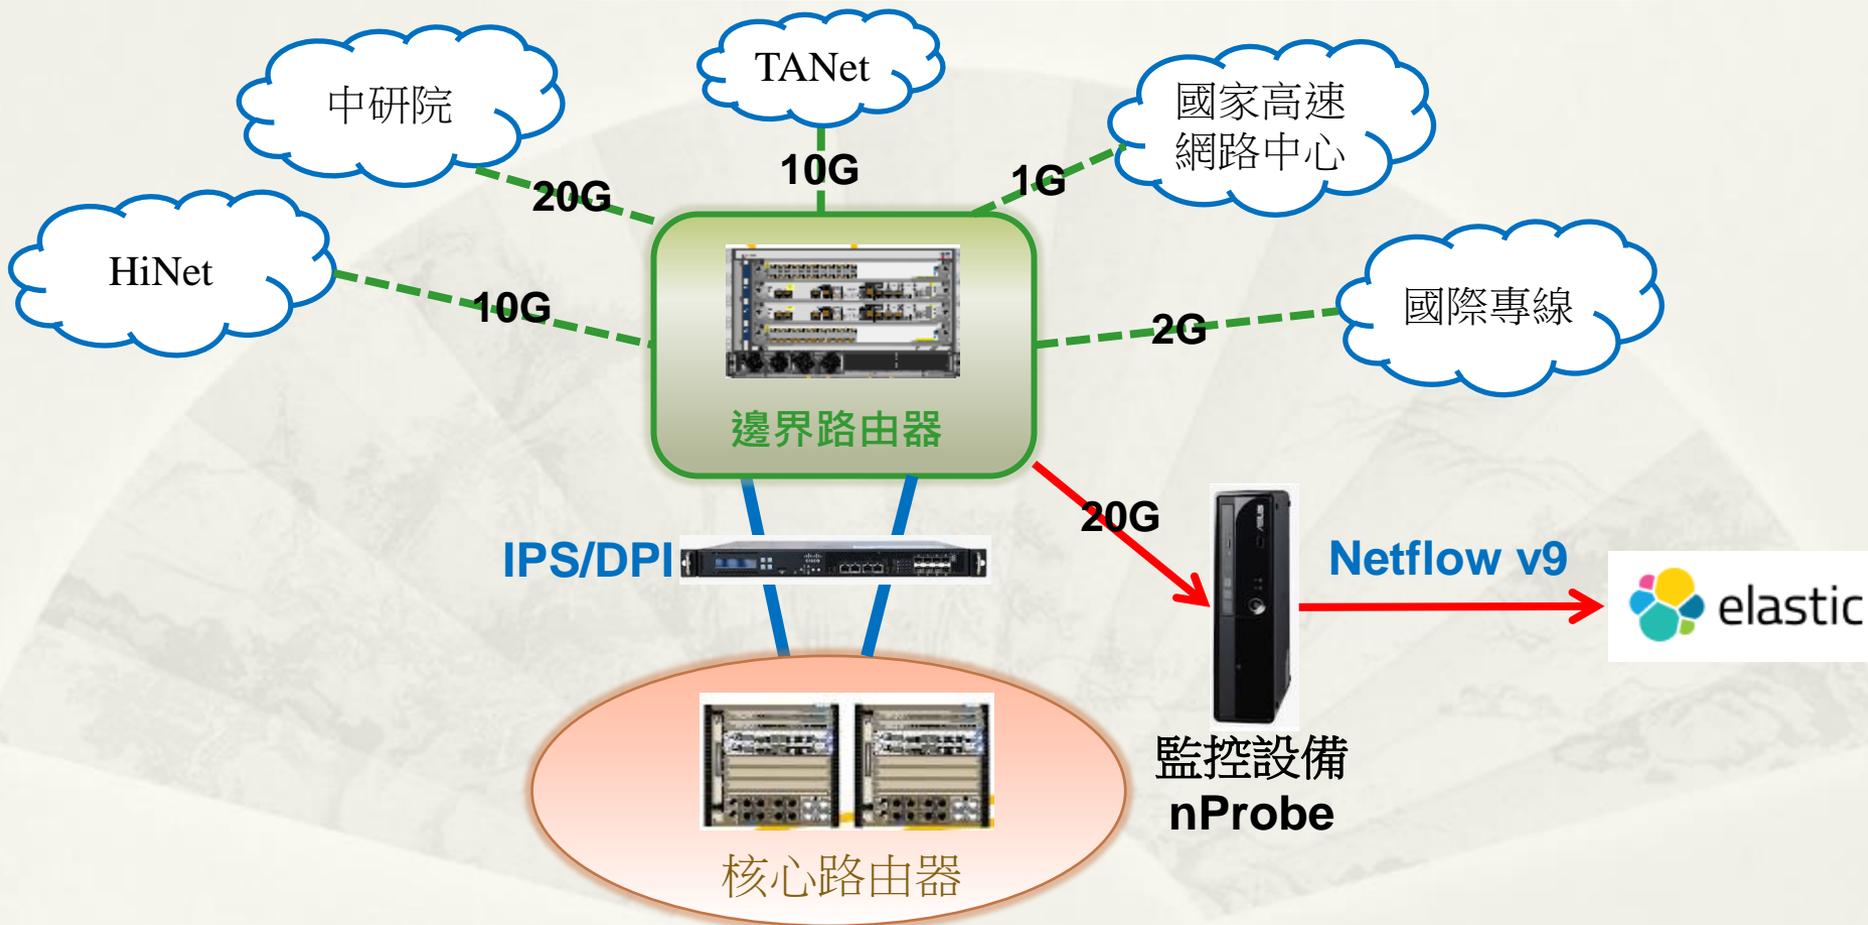

### \* 頻寬管理器/DPI 設備: Procera

# TCP-based 網路品質監控

## \* 優點

- \* 被動式偵測(封包 Listening)，不佔用頻寬資源
- \* 可快速釐清 Intranet or Internet 緩慢或異常
- \* 不需佈建監控設備，節省電力與資源
- \* 準確性更高: 網路現成大量連線記錄提供量測結果
- \* 可追溯過去之歷史統計記錄
